Dispenser for cleaning tissue
LOCTITE DEUTSCHLAND GmbH

Abstract:

The dispenser for a cleaning tissue (15) comprises a supply (3) of cleaning tissues (15), a tank (4) for receiving a supply of wetting liquid, and a device for wetting the cleaning tissue (15) with the wetting liquid. The wetting device has a funnel (8) through which a web of the cleaning tissue (15) is conducted, the funnel (8) being moved counter to a restoring force from a rest position into an operating position due to the carrying force exerted by the cleaning tissue (15) on the funnel (8) when the cleaning tissue (15) is pulled through the funnel (8). Due to the movement of the funnel (8) from the rest position into the operating position, wetting liquid is conducted into the funnel (8).
